SUPPLEMENTARY FIGURES

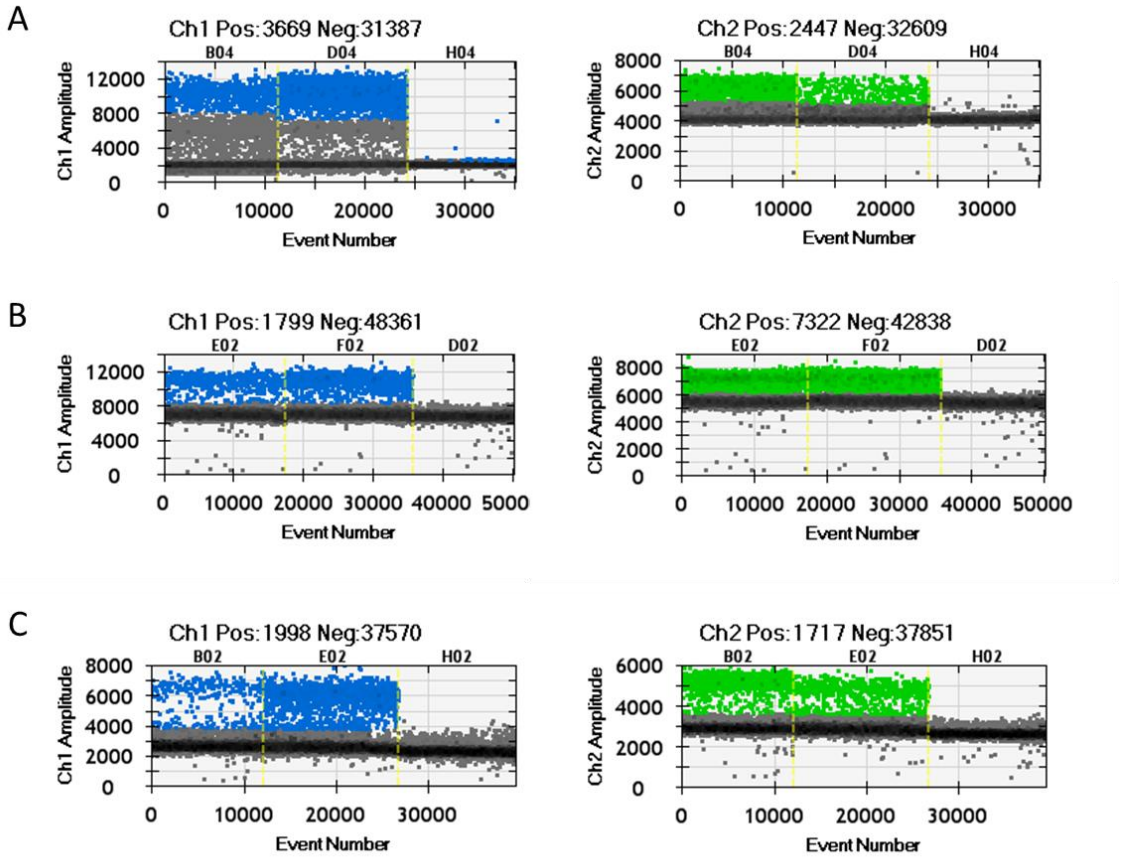

Figure S1. An example of the duplex ddPCR experiment for *ELOVL2*, *PDE4C* and *FHL2* genes. The one-dimension amplitude plot of the duplex assay is shown for: (A) *ELOVL2* in two blood samples from individuals with 2 years-old (B04) and 55 years-old (D04); (B) *PDE4C* in two blood samples from individuals with 4 years-old (E02) and 77 years-old (F02); (C) FHL2 in in two blood samples from individuals with 6 years-old (B02) and 78 years-old (E02). One non-template control (ntc) (H04, D02 and H02) is shown for each gene; 3) The blue color represents methylated positive droplets (FAM) and the green color represents non-methylated positive droplets (HEX); the black color represents the negative droplets.

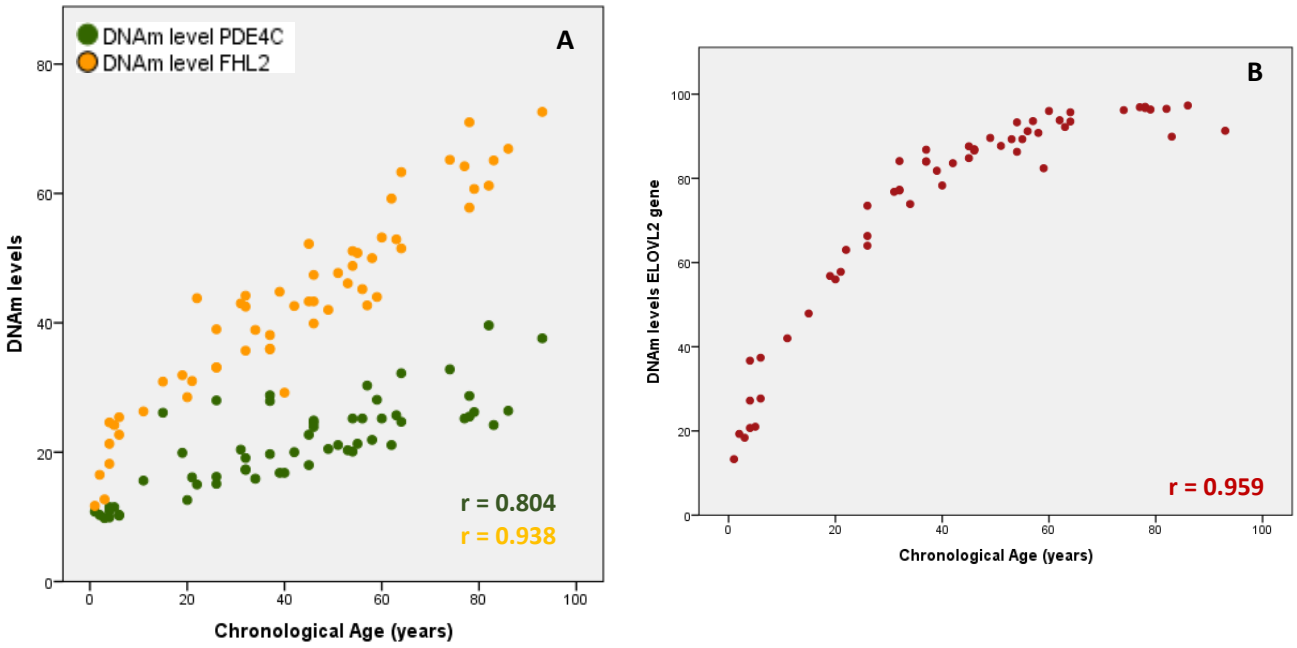

Figure S2. Correlation between DNAm levels of *FHL2*, *PDE4C* and *ELOVL2* genes and chronological age (years). The corresponding Spearman correlation coefficients (r) is depicted in each plot. (A) A straight linear positive fit was observed for CpGs located at *FHL2* and *PDE4C* genes; (B) A non-linear positive fit was observed for CpGs at *ELOVL2* gene.

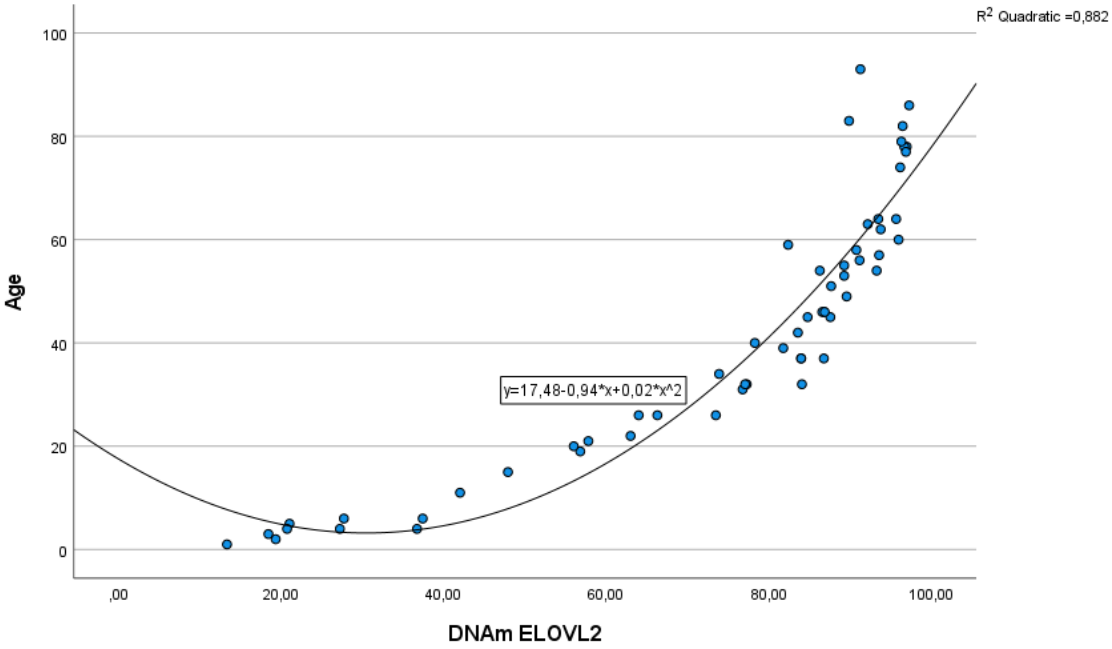

Figure S3. Quadratic regression model applied to the obtained *ELOVL2* data.
